RockIT Algo Trading

What is Profit Factor? Why Care?

What is Profit Factor?

The profit factor is a mathematical metric that divides the gross profits by the gross losses. The profit factor is basically a ratio of risk reward. Example : If you have a strategy that has accumulated $500 in profits and $250 in losses, the profit factor is two.

Basically, Profit Factor 2 means that if I invest $1, I can expect to get $2 back from trading the algorithm.

A profit factor higher than 1.5 means that you get half the investment corresponding value in profit, so for each dollar invested you earn 50+ cents.

What is an effective profit factor value? (Our Opinion)
A good profit factor in trading is above 1.7. We would be skeptical if the value is lower than 1.7, but at the same time, we are also skeptical if above 3.5. A realistic profit factor is around 1.75.

Important – You can increase your Profit Factor by implementing stop losses after you place the trade. The effective way to increase profits.

Note – The above are our opinions, and we are not financial experts to provide accurate guidelines. Please do your own due diligence before acting on information explained.
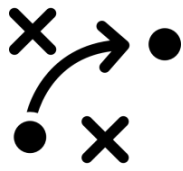

# Chart Type – Regular Trading Hours / Candle Stick.

RockIT Algo strategy (profit realized and profit factor) has been tested for REGULAR TRADING hours.

Make sure you set your chart to Regular Trading hours

Set your chart to 'Regular Trading Hours'

1

Profit Factor
You can trade taking into consideration profit tracker or profit generated. It is an individual preference based on trading personality.

2

Stop Loss
After entering a long or short trade we always put our stop loss orders to minimize losses.
The truth and fact is that losses will be there. You control them and you will profit.
Treat it as a business – Keep expenses (losses) low and revenue (profit) high.

Setting up RockIT Algo – Trading the Signals

Follow the below steps to set up. Each step is very important.

BUY SIGNAL

When You Get BUY Alert – Buy CALL Option & Close Bought PUT Option

Buying Call Option

- Select option strike price that has around 0.10 Delta.
- Purchase 10 contracts

IF Trading Forex Pair – Buy Signal
Open Long & Close Short.

SELL SIGNAL

When You Get SELL Alert – Buy PUT Option & Close Bought CALL Option

Buying Put Option

- Select option strike price that has around 0.10 Delta.
- Purchase 10 contracts.

IF Trading Forex Pair – Sell Signal
Open Short & Close Long.

Repeat from signal to signal.

Setting up RockIT Algo – The Stop Loss

The stop loss amount is subjective in nature and depends on your trading style, volatility and forex price.
Usually, we follow price action to define our stop loss amount. Strategy illustrated below.
Note – Develop your own strategy based on what has worked for you in the past.

FOR BUY (Long Position) - Stop Loss Level
- We usually use the LOWEST value of past 2-4 candles.
- Sometimes if candle length is tall then I use the low of the tall candle.
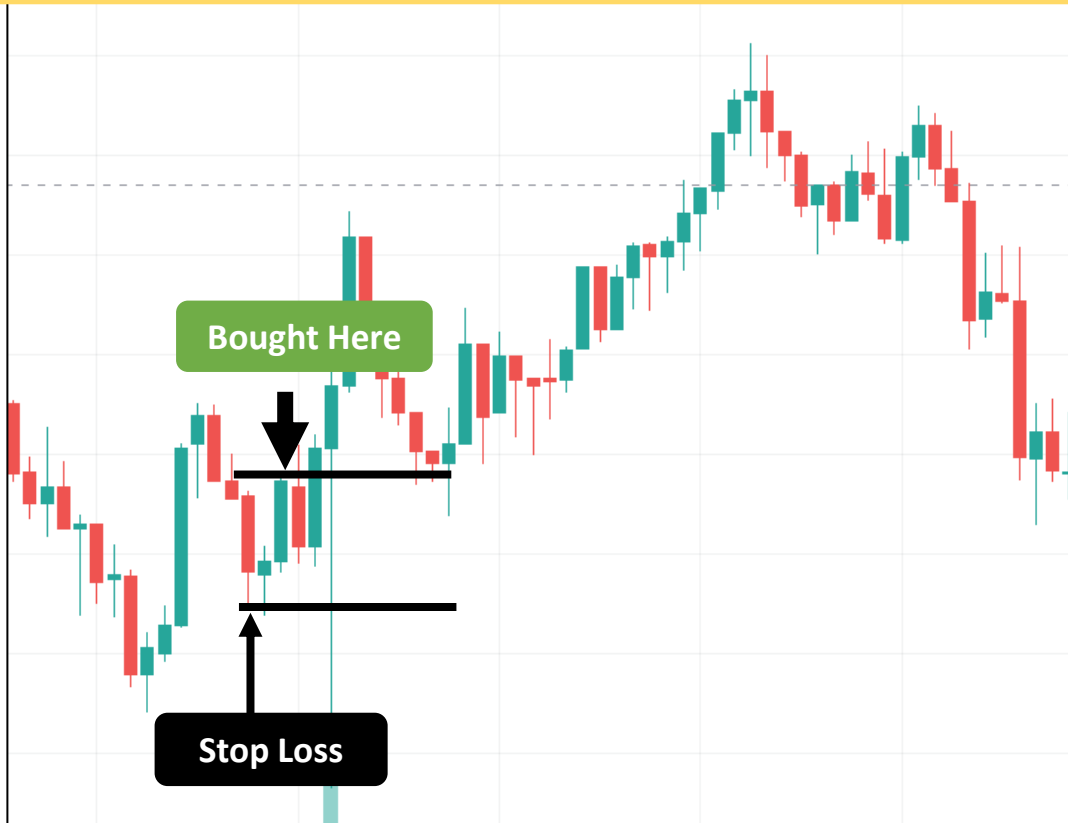

FOR SELL (Short Position)- Stop Loss Level
- We usually use the HIGHEST value of past 2-4 candles.
- Sometimes if candle length is tall then I use the high of the tall candle.

Important points you have to execute for the strategy to be successful.

Stop Loss

It is not necessary to have a stop loss as RockIT Algo takes care of it. However, we trade with a stop loss as this decreases our losses and increases our profits (returns).

We do recommend you put a stop loss in place based on your strategy.

Trade Small

Begin by trading small. Increase size as you collect profits.

Consistent Trading (Options)

1. Trade the same delta for both Call and Put options.
2. Trade the same number of contracts for both Call and Put options. Do not trade unevenly.
3. If you want to increase or decrease, then trade the same number of contracts for both calls & puts.

Consistent Trading (Forex)

1. Trade the same dollar amount for both long (buy) and short (sell).

Why consistent trading?

You want both profit and loss to be on equal footing. Sometimes if you trade bigger and incure a loss then your loss will outweigh your profit because you traded smaller when there was a profit.
